User Interface / User Experience Proposed Software Design Project Title Pre-approval Form

(Refer to attached initial title proposal)

Dear Panel Member,

Attached is the Chapter 1 to 3 of the project proposal for USERINX CpE251 containing the approved Chapters 1 and 2, and Chapter 3: Information Architecture, Navigation Structure, User Flow, Wireframes, Design Standards, High Fidelity User Interface Design, and Usability Considerations.

Please determine if the attached project proposal is approved for proposal defense in terms of feasibility and relevance to CpE's field of specialization.

Once approved, the proponents are expected to proceed with system design documentation (Chapters 1 to 6) as a requirement for Database Management course.

Possible Recommendations:

- **Approved** – The proposed title is accepted without revisions. The project team may proceed to the Proposal Defense.
- **Approved with Revisions** – The proposed title is accepted subject to the completion of the required revisions. The project team may proceed to the Proposal Defense upon compliance with the panel's recommendations.
- **Change Topic** – The proposed title is not approved. The project team shall propose a new project topic that addresses the recommendations of the evaluation panel.

If the project receives a Change Topic result during the scheduled Title Defense, the remaining defense schedule allocated for the UI/UX course shall be used for the Proposal Defense of the revised project. Any additional proposal defense, if required, shall be conducted during the next offering of the UI/UX course.

PROPOSED TITLE	RECOMMENDATION
Development of a Centralized Curriculum Management and Mapping System with Role-Based Access Control and Audit Logging	

Comments

Comments	Actions Taken	Remarks
It is unclear which part of the system performs the “flagging of terminal professional and capstone courses that lack demonstrative designation.” The proponents must clarify what the flag looks like (e.g., a notification or a red flag). (Flagging and Progression Validation Comment).	Added a yellow warning bar and an 'Advisory' button at the top of the curriculum matrix and flowchart. When a final course (like Capstone) is missing its Demonstrative (D) mark, the yellow button appears. Clicking it opens a popup that explains what is missing, but it still lets the user save their work.	
The real-time computation of credit units and contact hours per SO is useful for tracking, but it was not suggested by the panel. (Student Outcomes Summary Comment).	Removed the credit unit and contact hour calculations. The system now shows the simple count of how many courses are linked to each Student Outcome (SO a to m).	
The proponents must explain where the directed acyclic graph (DAG) and cycle detection appear in the system. For example, a later subject cannot be set as the prerequisite of an earlier one. (Cycle Detection and Flowchart Comment).	Added loop detection in the Flowchart editor. If a user accidentally makes two courses prerequisites of each other (like Course A requires B, and B requires A), the system shows a red	

Comments	Actions Taken	Remarks
	warning banner and stops the user from saving the loop.	
The dynamic curriculum flowchart with prerequisite and post-requisite highlighting and SVG/PNG export is primarily a curriculum feature. This must be made clear in the presentation. (Cycle Detection and Flowchart Comment).	Placed the flowchart, course line highlighting, and image export directly under Curriculum Management as part of the main curriculum builder.	
The scope must be checked against the objectives. If all scope items are met but an objective is missed, an unresolved problem remains. (Scope and Document Comment).	Reviewed all project objectives to make sure every required feature is fully supported by the system.	

For revisions

Revisions	Actions Taken	Remarks
The back end design is disorganized because viewing, editing, creating, and publishing are combined in one place. These must be separated into a creation facility, an editing facility, and a viewing facility for published curricula. (Viewing and Editing Comment).	Separated curriculum actions into three clear areas: (1) creating a new curriculum, (2) editing an active draft (like AY 2027), and (3) viewing published curricula in read-only mode (like AY 2026) where editing is locked.	
The curriculum version used by a batch should be displayed instead of the year level, since a batch moves up one year level every year. (Curriculum and Batch Labeling Comment).	Updated the screen headers, dropdowns, and labels to show the curriculum version (like 'CPE 2026' or 'CPE 2027') instead of student year levels (1st Year to 4th Year).	
Batches must be labeled by curriculum version (e.g., 2015A) and batch number (e.g., Batch 2006). (Curriculum and Batch Labeling Comment).	Labeled batches using both the curriculum version and entering batch year (for example, 'CPE 2026 [Batch 2026]') on the Curriculum Workbench, Directory, and Version History screens.	
The overlapping opening and closing parentheses in “2025 to 2029” and “2024 to 2028” are confusing and must be clarified. (Curriculum and Batch Labeling Comment).	Cleaned up all dropdowns and menus to remove confusing parentheses, using simple labels like 'AY 2026-2027' and 'CPE 2026'.	
The wording “detection of illogical progression sequence across prerequisite chains” is unclear. It must be explained better with an example, such as Capstone 1 being Introductory, so Capstone 2 cannot proceed directly to Demonstrative. (Flagging and Progression Validation Comment).	Added an example to clarify progression warnings: if Course 1 is Introductory (I), Course 2 cannot jump straight to Demonstrative (D) without an Enabling (E) course in between. The system flags this skipped step with a yellow warning tag.	
The validation must serve as a warning only and must not block the user. (Flagging and Progression Validation Comment).	Made sure all progression warnings are advisory only. They show up as yellow badges in the table and in a popup window to alert the user, but the user can still save their changes.	
The system actually displays a count of courses per SO, not credit units. Either the wording or the	Updated the Student Outcomes matrix to clearly display the count of courses mapped to each	

Revisions	Actions Taken	Remarks
computation must be corrected. (Student Outcomes Summary Comment).	outcome rather than credit units.	
All approved functions must be anchored in Chapter 1. Nothing that has not been approved may be presented. (Scope and Document Comment).	Removed unapproved extra features from the system, keeping only the approved features.	
Some words in the document are unclear to readers and must be double-checked. (Scope and Document Comment).	Simplified all wording across the system and documentation, replacing confusing jargon with clear, standard explanations.	

Additional requirements (additional objectives that needs to be included in the complete proposal)

Additional Requirements	Actions Taken	Remarks
Transactional staging with error reporting should be used to catch malformed entries, such as a course code that is already in use. This prevents partial or corrupted imports. (Import / Spreadsheet Comment).	Added a preview screen when uploading Excel files. The system checks for duplicate course codes and missing fields before saving anything, so incomplete or corrupted data is not saved.	
The import function must show the location of errors, including missing and excess columns and rows. These errors must be visible on the import page. (Import / Spreadsheet Comment).	Added an error list right on the import screen that points out the exact row, column, and issue (such as a missing unit or duplicate code) before the file is imported.	
Limits must be set on imports. Merged cells must be prohibited, since the Excel file used in the demonstration contained merged cells and caused a column error. (Import / Spreadsheet Comment).	Set a rule that imported Excel files cannot have merged cells. If a file has merged cells, the system shows an error message asking the user to unmerge them first.	
There is no facility for inputting or editing the vision, mission, and similar items. There is also no versioning, so editing them alters all previous files. (Vision, Mission, GA, PEO, SO Comment).	Added an admin page to manage the University Mission, Vision, and Core Values. Each update is saved as a new version, so older curriculum records keep their original text.	
Facilities for creating and revising Graduate Attributes (GA), Program Educational Objectives (PEO), and Student Outcomes (SO) must be added, since the current system only changes text. (Vision, Mission, GA, PEO, SO Comment).	Added management screens to create, edit, and track versions for Graduate Attributes (GA), Program Educational Objectives (PEO), and Student Outcomes (SO).	
Each item must have its own version number, as the previous system had for the mission. Each version must also refer to the version it is built upon: the SO refers to the PEO version, and the PEO refers to the GA version. (Vision, Mission, GA, PEO, SO Comment).	Linked the version history together: every SO version points to its base PEO version, and every PEO version points to its base GA version.	
Published curricula, such as the 2024 and 2025 curricula, must not be editable. An edit must only	Locked published curricula (like CPE 2026) so they cannot be edited. To make changes, the user	

Additional Requirements	Actions Taken	Remarks
be possible by creating a new version. (Viewing and Editing Comment).	must create a new draft version (like CPE 2027).
